**Abstract.** *The research subject* in the article is the correlation between evaluation indicators of primary energy resources in the fuel and energy sector in the Northwestern Federal District of the country. The purpose for the study is to evaluate the primary energy resources of the fuel and energy sector in the Northwestern Federal District in terms of economic, technological, energy, social, and environmental parameters with the use of balanced scorecard (BSC) for sustainable development of the sector in the Northwestern Federal District as a whole. *Methods.* The article proposes the methodology for territorial decomposition of the balanced scorecard for evaluating primary energy resources in the Northwestern Federal District. The region's balanced scorecard decomposition of evaluation of primary energy resources in the case of the Arkhangelsk Oblast fuel and energy sector, including Nenets Autonomous Okrug, is determined; the authors identify the degree of stability of the fuel and energy sector in the Arkhangelsk Oblast, according to the following parameters of sustainable development of the energy sector in the Northwestern Federal District: economic, technological, energy, social, environmental. *Research results.* The authors determine the degree of sustainability of the fuel and energy sector in the Arkhangelsk Oblast in general and by individual parameters of sustainable development. The state of sustainable development is observed only on by the energy parameter. *Conclusions.* It is concluded that instability may be due to the fact that the deposits of primary energy resources belong to the Northern Arctic areas. This factor directly affects the economic efficiency of deposit development in this territory as there is, on the one hand, a

**For citation:** Salina T.K. Territorial Decomposition of Balanced Scorecard for Evaluation of Primary Energy Resources in Fuel and Energy Sector in the Northwestern Federal District to Ensure Its Sustainable Development. *Economic and Social Changes: Facts, Trends, Forecast*, 2017, vol. 10, no. 5, pp. 128-142. DOI: 10.15838/esc/2017.5.53.9

decrease in world energy prices and, on the other hand, – an increase in resource development costs. The growing costs are related to the necessary formation of the required infrastructure, social benefits, use of equipment suitable for operations in these conditions. The theoretical significance consists in the fact that the study expands scientific knowledge in the sphere of management decision-making for sustainable development of the sector in the region and its constituent entities through conducting territorial decomposition of BSC of evaluating primary energy resources in the fuel and energy sector. The practical value of the research is to develop the territorial decomposition of BSC of evaluation of primary energy resources which help correctly and objectively assess the sustainability of the fuel and energy sector development in the Northwestern Federal District, which contributes to the transformation of fuel and energy sector in the Northwestern Federal District into a flexible, adaptable system with high resistance to the disturbing environmental influences.

**Key words:** fuel and energy sector, balanced system of indicators, primary energy resources, sustainable development.

**Introduction.** The concept of sustainable development (SD), according to Agenda 21 adopted at the United Nations Conference on Environment and Development held June 14th, 1992 in Rio de Janeiro, and a number of subsequent documents<sup>1</sup> are the basis for the transition to sustainable development. The provisions of the concept are reflected in many international agreements developed on the basis of national concepts of sustainable development, including those published in Russia, such as the Concept of Russia's transition to sustainable development, the Environmental doctrine of the Russian Federation, the Climate doctrine of the Russian Federation, the Concept of long-term socio-economic development of the Russian Federation up to 2020, the Energy strategy of Russia up to 2030, and other legal acts reflecting the principles of sustainable development, as well as in the works of scholars working on the issues of sustainable

development, for example, V.A. Vasilenko [5], Yu.P. Grigorieva [6], and in the proceedings of Institute of the energy strategy [1; 4].

The process of global sustainable development is based on the influence of global factors and the consideration of specific characteristics of each country's economy, its resource potential, economic, natural, geographical, and other conditions, namely, the components which form the framework of the system of sustainable development. In this regard, trends in the study of the issues of interaction between the society and environment, between nature and human activities become relevant.

In order to achieve sustainable development it is necessary to develop appropriate mechanisms to manage the sustainability of national economies, as well as its constituent regions [5] and industries, including fuel and energy complex (e.g., V.I. Kalika [10], T.A. Moiseenkova [12], Grigor'eva Yu.P. [7; 8]). In this term, the goal of the fuel and energy complex (FEC) is to meet the population's needs in energy resources at economically reasonable prices, maintain the stability of the energy market and ensure environmental safety [2; 9].

<sup>1</sup> One of the recent documents aimed at achieving sustainable development is the 2030 Agenda for Sustainable Development reflecting 17 goals of sustainable development. Available at: <https://documents-dds-ny.un.org/doc/UNDOC/GEN/N15/291/92/PDF/N1529192.pdf?OpenElement> (accessed: 01.01.2017).

The essence of the strategies of socio-economic development of the state, namely the Concept of socio-economic development of Russia up to 2020, the Strategy for socio-economic development of the Northwestern federal district (NWFD), as well as the Energy strategy up to 2030 (ES-2030) focused on innovative and sustainable development of FEC as a driver of economic growth is that they have a direct impact on the socio-economic development of the country in general and the Northwestern federal district in particular: on the achievement of economic growth, increase in population's welfare [8]. In this context, the study of the role of FEC in sustainable development of the country as a complex multilevel system becomes highly relevant.

Russia's Northwestern federal district is a major promising area of FEC development in the European Russia. The raw material profile of the region is in the long term attributed to geographic proximity to major energy consumers and export pipeline systems.

Most modern FEC development scenarios for the country in general and NWFD in particular originate from the key role of primary energy resources (PER)<sup>2</sup> in the energy supply of the national economy [13]. Changes in conditions of FEC functioning, namely depletion of the developing supplies of energy resources, increasing competition for access to new mineral deposits, the influence of natural factors, the need for development of underdeveloped less efficient resource deposits, deposits located in remote areas with harsh geological and climatic conditions, and the need to develop the necessary infrastructure.

<sup>2</sup> In the article, primary energy resources (PER) are referred to explored resources quantitatively confirmed by drilling with their possible delivery to material use for further preparation of secondary energy resources.

Thus, the development of economic tools for sustainable development of FEC in the NWFD<sup>3</sup> which would take into account economic, technological, energy, social, and environmental aspects of its functioning, as well as its components, namely FEC of its entities forming the FEC in the NWFD is an urgent objective [13].

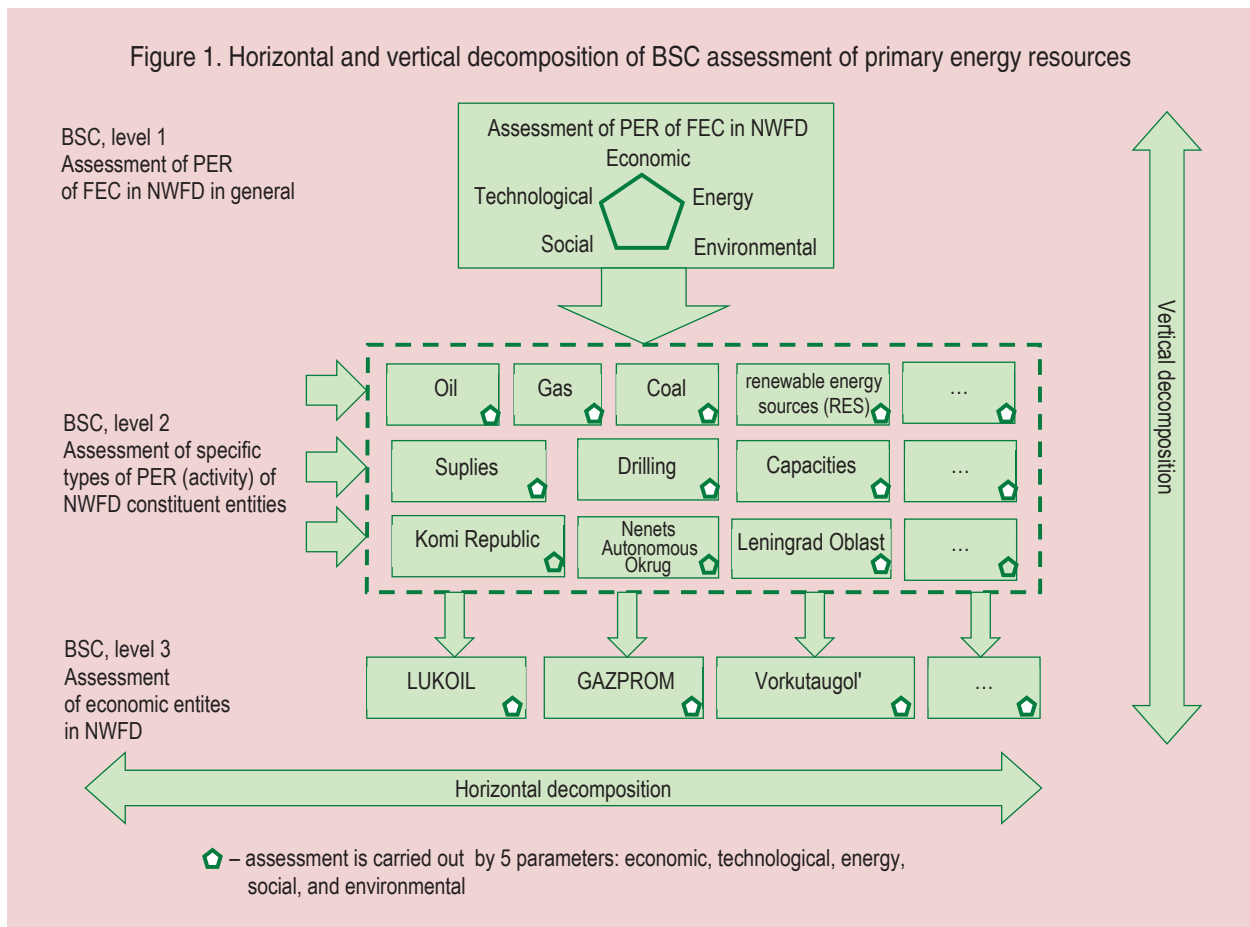

In the article, the author offers balanced scorecard (BSC) assessment of PER of FEC in NWFD in general and of its separate elements as an economic tool for sustainable development of FEC in NWFD since this system has an advantage: there is a possibility to interrelate economic, technological, energy, social, and environmental parameters of functioning of FEC in NWFD. More about the advantages of BSC see in works by M.G. Brown [3], D. Norton and R. Kaplan [11; 19; 20] and other foreign studies [16; 17; 18].

The nature and content of BSC assessment of primary energy resources to ensure sustainable development of FEC in NWFD is covered in [18]. The article proposes a decomposition of BSC assessment of primary energy resources for individual entities in NWFD.

### **1. The decomposition methodology of the BSC assessment of primary energy resources of FEC in NWFD.**

Decomposition to lower management levels of sustainable development of FEC in NWFD is carried out according to the development objectives so that the objectives of lower levels are not contrary to those of higher levels. The

<sup>3</sup> *Sustainable development of FEC in the NWFD* – permanent, limited to a certain period of time accepted for planning and control, positive change in framework interdependent economic, social, technological, energy, and environmental parameters of the FEC system. More about the approach to the management of sustainable development in the FEC in the NWFD see in [13].

construction of BSC assessment of primary energy resources of a single entity in NWFD is advisable to be carried out according to specific features of a specific constituent entity of the Russian Federation which is a part of NWFD and produces energy resources. Goals of sustainable development of entities in NWFD should contribute to the achievement of the development goals of the entire complex.

According to the proposed approach, the decomposition of BSC assessment of PER in NWFD can be carried out in two directions (Fig. 1):

– horizontally (at the same hierarchical level): resource decomposition (by type of energy resource); process decomposition (by type of a process [7]);

– vertically – involvement of other management levels (territorial decomposition).

The article proposes the methodology for territorial decomposition of BSC assessment of PER in constituent entities of NWFD.

The territorial decomposition is carries out in order to:

1. Develop the indicators for assessment of PER of a constituent entity of the Russian Federation according to parameters of sustainable development of FEC in NWFD (economic, technological, energy, social, environmental);
2. Reflect the contribution of individual constituent entities of the Russian Federation to the achievement of target values of indicators of assessing PER.

3. Focus the management processes on key framework indicators for assessing PER to ensure sustainable development of FEC in NWFD.

The territorial decomposition of BSC is performed according to the following steps:

1. Defining the territorial structure of decomposition. Target indicators and their values for a constituent entity of the Russian Federation are formulated depending on the economic situation in the region. BSC in general acts as a framework within which BSC assessment of PER of a constituent entity in NWFD is formed for a lower level.

2. Framing of development goals for FEC of a NWFD constituent entity in the framework of general goals of sustainable development of FEC in NWFD.

3. Development of indicators for assessment of PER. The indicators are fully transferred from BSC assessment of PER of FEC in NWFD to regions. However, their target and threshold values may be adjusted depending on specific characteristics of the region on coordination with higher management levels in a way that does not contradict to sustainable development of the entire complex.

4. Reflection of cause-and-effect relations between parameters of sustainable development and their indicators (PER scorecard). PER scorecard reflects cause-and-effect relations between separate PER assessment indicators. Cause-and-effect relations are reflected in the scorecard in the following objectives:

- to demonstrate the relations and correlation between performance indicators;
- to reveal the mutual effects arising from the implementation of sustainable development objectives;
- to provide a common understanding of the state of FEC sustainable development;

- to ensure the achievement of goals of sustainable development;

- to contribute to the establishment of the management hierarchy.

5. The establishment of target indicator values. Assessments of PER of FEC in NWFD for its constituent entities are established based on target values of indicators. But, depending on specific characteristics of the region, they can change their value by decision of the governing bodies with stating the reason.

6. Threshold values of indicators. Threshold values for indicators are set to determine the degree of stability of development of FEC in NWFD.

A threshold indicator value is the value of the indicator of PER, the achievement or exceeding of which is considered as a transition of the given indicator to a qualitatively new larger area of with higher loss of sustainable development in FEC of the region. The degree of sustainability of the region's FEC is a conditional indicator characterizing the degree of achievement of target indicator values of assessment of PER for sustainable development of FEC of the region.

The author presents the following degrees of sustainable development of FEC in the region for each parameter. In turn, the borderline state and the state of instability are divided into three stages:

I. Sustainable development (SD) – achieving or improving of target indicator values.

II. Borderline state (BS): minor loss of sustainability (MLS) – a deviation of not more than 10% from target values of indicator of PER assessment; increasing sustainability loss (ISL) not more than 20%; the stage of transition to the state of unsustainable development (TSD) – no more than 30%.

III. Unsustainable development: the initial stage of unsustainable development (NSNU) – not more than 40%; significant loss of development sustainability (SLDS) – not more than 50%; complete loss of development sustainability (CLDS) – more than 50%.

The boundaries of states of sustainability may vary depending on the purpose of analysis and the state of FEC development, as well as on strategic goals of its development.

7. Assessment and specification of the degree of stability. The specification of FEC sustainability may be conducted based on the approach proposed in [7].

8. Documentation of results.

9. Coordination of decomposition results with higher levels of management. At this stage, depending on the obtained evaluation results, management influence may be adjusted to ensure sustainable development.

10. Comparison of assessment results with the FEC development goals in the region. At this stage, it is necessary to define the contribution of NWFD constituent entity in achieving the goals of sustainable development of FEC in NWFD. The goals at all management levels can be adjusted in order to develop mechanisms to achieve them.

## **2. Territorial decomposition of BSC assessment of PER (the case of the Arkhangelsk Oblast, including Nenets Autonomous Okrug).**

### *2.1. The structure of the territorial decomposition of BSC.*

Territorial decomposition is carried out for regions producing energy resources. In the article, the BSC decomposition will be carried out in the case of the Arkhangelsk Oblast.

### *2.2. Formulating FEC development goals in the Arkhangelsk Oblast and formation of indicators to assess primary energy resources.*

When forming BSC assessment of PER in the Arkhangelsk Oblast, assessment indicators are fully transferred from the total BSC. In this case, the contribution of FEC in NWFD in the achievement of target indicator values of FEC in NWFD is determined (*Tab. 1*).

### *2.3. PER scorecard in the Arkhangelsk Oblast.*

PER scorecard in the Arkhangelsk Oblast is created on the basis of overall scorecard of PER assessment of FEC in NWFD (*Fig. 2*).

Documentation of cause-and-effect correlation between separate indicators is carried out simultaneously with their development. The correlation is characterized by the following data: number of correlation, indicator which has an influence or is influenced; “transcript” of the correlation; how the change in A parameter value influences the achievement or non-achievement of the target parameter value; brief description of correlation content.

(1) strong influence. Short-term investments (E21, E22, E23) adversely affect the indicators of economic efficiency. At the beginning of the period there is an increase in the cost, later – a decrease.

(2) strong influence. Capital investments (E21, E22, E23) have a direct impact on the technological infrastructure (T11, T12) of the production process. Investments in modern equipment and technology improves the condition of fixed assets and increases innovation activity of fuel enterprises.

(3) strong influence. The technological infrastructure (T11, T12) of the production process has a direct impact on PER production efficiency (T21, T22, T23). The better the condition of fixed assets, the higher innovative activity, the higher is the efficiency of natural resource management (oil recovery rate, oil gas use rate).

Table 1. Documentation of sustainable development goals and indicators for assessing PER in the Arkhangelsk Oblast (AO)

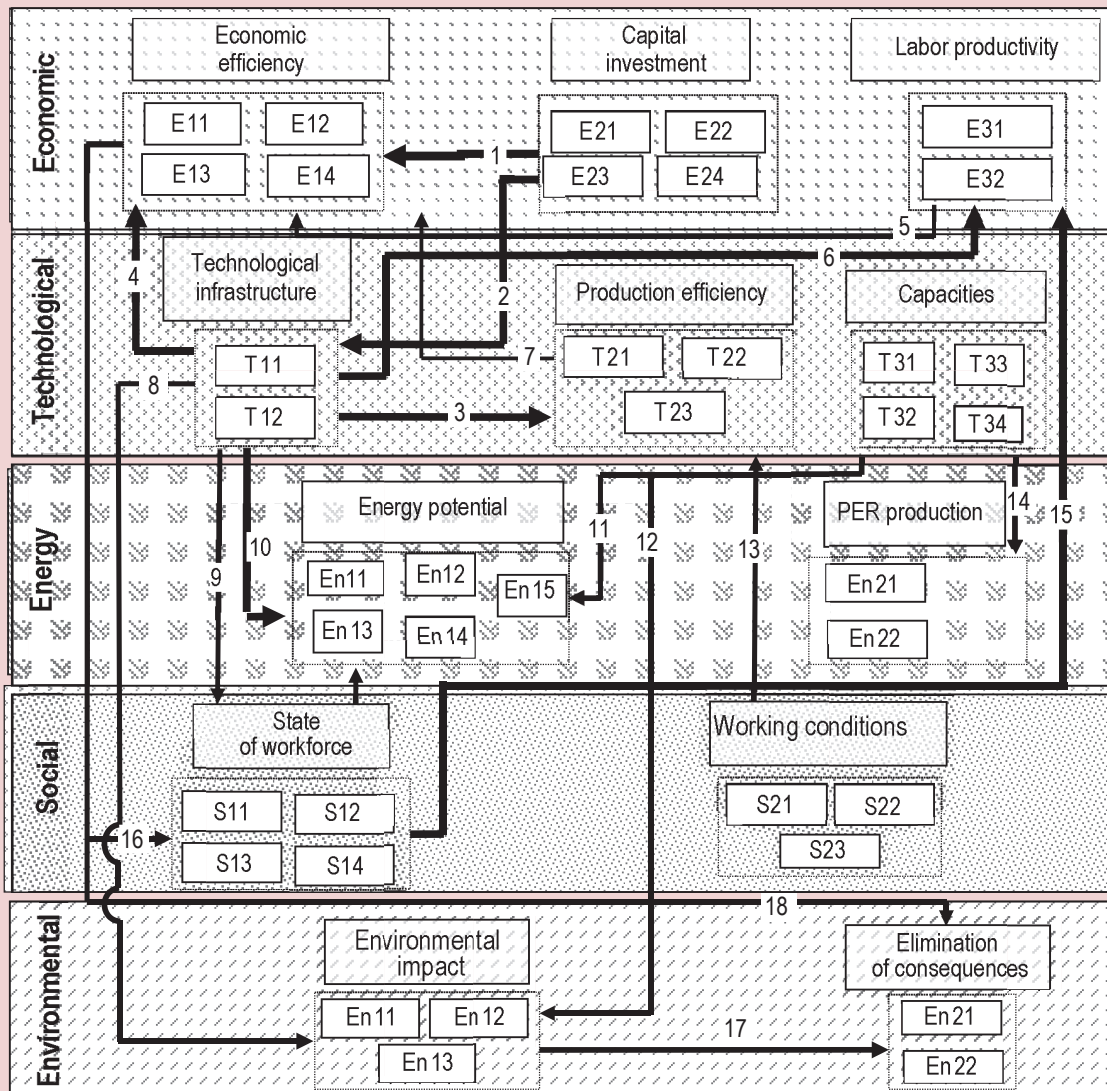

<i>Goal of SD</i>		<i>No. E1 (AO)</i>
Parameter of SD of FEC in NWFD	Economic	
Goal subject	Ensuring economic efficiency of PER production to ensure SD of EFC in NWFD	
Goal validation	Achieved through reducing the cost of PER production and financial sustainability	
Assessment indicators	Cost development rate Change in production costs per 1 RUR of gross output (GO) PER production profitability Financial sustainability	E11(AO) E12(AO)  E13(AO) E14(AO)

Period	Up to 2030	

Figure 2. PER scorecard assessment in the Arkhangelsk Oblast

(4) strong influence. The technological infrastructure (T11, T12) of the production process has a direct impact on production efficiency (E11, E12, E13, E14, E15). This correlation is due to the fact that the condition of fixed assets and innovative activities affects the growth rate of PER cost, profitability, etc.

(5) moderate mutual influence. Labor productivity (E31, E32) has an impact on economic efficiency (E11, E12, E13, E14). The

more gross output per one employee engaged in production of PER, the more economically efficient it is. On the other hand, the more capital investments, the higher is labor productivity through the use of modern technology.

(6) strong influence. The technological infrastructure (T11, T12) of the production process has a direct impact on productivity.

(7) moderate influence. The efficiency of the production process (T21, T22, T23) has an

impact on economic efficiency (E11, E12, E13, E14) since, for example, accident elimination requires costs.

(8) rather strong influence. The technological infrastructure (T11, T12) in PER production has a direct impact on the environment (accident spills due to deterioration of equipment).

(9) strong influence. The technological infrastructure (T11, T12) in PER production characterizes the working conditions.

(10) strong influence. The technological infrastructure (T11, T12) of the production process characterizes the reproductive capacity of the district. This is due to the fact that there are resource supplies whose development is possible only with the use of modern equipment.

(11) strong influence. Production capacity (T31, T32, T33, T34) affect the possibilities of reproduction, as well as on the formation of the energy potential of NWFD.

(12) rather strong influence. PER production (T21, T22, T23) has a direct impact on the environment (accident spills due to deterioration of equipment).

(13) rather strong influence. The satisfaction of employees affects the production efficiency as the better the working conditions (C21, C22, C23) the higher is PER production efficiency.

(14) rather strong influence. Due to the development of capacities (T31, T32, T33, T34) it becomes possible to satisfy the energy demand by developing new deposits.

(15) strong influence. The state of workforce (C11, C12, C13, C14) has a direct impact on productivity.

(16) rather strong influence. The higher the quality of workforce (C11, C12, C13, C14) the greater is the cost of its content (E11, E12, E13, E14).

(17) rather strong influence. The greater the negative impact on the environment (Ec11, Ec12, Ec13), the higher is the scale of consequences for elimination (Ec21, Ec22).

(18) rather strong influence. In order to eliminate the consequences of environmental impacts (oil spills, sludge pits, etc.) (Ec21, Ec22) it is necessary to invest (E11, E12, E13, E14).

*2.4. The establishment of target values of indicators of assessment of primary energy resources in the Arkhangelsk Oblast.*

Target values are set for all regions in NWFD for periods of implementation of strategic documents (ES-2030) broken down into three periods based on the experience of leading companies of ES-2030, research of designated organizations. More about the rationale of indicators and their target values see in [14]. Further we perform the documentation of target values of indicators of PER assessment and establishment of their actual values (*Tab. 2*).

*2.5. Threshold indicator values.*

Threshold indicator values are defined according to the method proposed in [7]. *Table 3* demonstrates the results of threshold indicator values iterations for assessing PER in the Arkhangelsk Oblast.

*2.6. The evaluation and determination of the degree of sustainability.*

The results of determining the degree of sustainability of FEC in the Arkhangelsk Oblast as a whole and by individual parameters are given in *Table 4*.

### **Conclusion**

Based on the assessment we can draw the following conclusion: sustainable development is achieved only by the energy parameter. This is due to the fact that this constituent entity of the Northwestern FD possesses PER

Table 2. Documentation of actual values of indicators of an estimation of primary energy\*

PER assessment indicator	Target value	Actual value (2014)
<i>Economic parameter</i>

Table 4. Determination of the degree of sustainability of FEC development in the Arkhangelsk Oblast including Nenets Autonomous Okrug

Parameter	Normalized values of degrees of FEC development sustainability in NWFD						Parameter assessment	State of FEC in NWFD
	BS			USD				
	MLS	ISL	TSD	ISUD	SLDS	CLDS		
Economic	0.00	0.35	0.69	1.00	1.30	1.59	1.79	Complete loss of development sustainability
Technological	0.00	0.35	0.00	0.34	0.67	1.00	1.94	Complete loss of development sustainability
Energy	0.00	0.37	0.70	1.00	1.27	1.51	0.00	Sustainable development
Social	0.00	0.34	0.67	1.00	1.33	1.65	1.5	Significant loss of development sustainability
Environmental	0.00	0.31	0.65	1.00	1.38	1.79	0.59	Increasing loss of development sustainability
<b>FEC</b>	0.00	0.34	0.67	1.00	1.32	1.64	<b>1.16</b>	<b>Initial state of unsustainable development</b>

reserves such as oil and gas. As for the remaining parameters, with the exception of the environmental parameter, unsustainable development is observed. In general, FEC of the Arkhangelsk Oblast including Nenets Autonomous Okrug, is experiencing unsustainable development at the initial stage. This situation may be due to the fact that PER deposits of FEC belong to the Northern Arctic areas (Northern part of the Timan-Pechora Basin). This factor directly affects the economic efficiency of deposit development at this territory as there is, on the one hand, a decline in world energy prices, on the other hand, an increase in the cost of resource development. The increase in the costs is related to the need to form the required infrastructure, to use equipment suitable for working under these conditions, to the social benefits, etc.

Thus, the implementation of the territorial BSC decomposition for assessing PER to ensure sustainable development of FEC in NWFD can help:

- improve coordination of actions of governing bodies of FEC and constituent entities of NWFD to ensure sustainable development of FEC in NWFD through reflection of the contribution of each entity

of the Northwestern Federal District in the implementation of objectives of sustainable development of FEC in NWFD as a whole;

- define the correlation between indicators of PER assessment of various parameters affecting sustainable development of FEC in NWFD;

- provide the management system of sustainable development of FEC in NWFD with full accurate information on constituent entities of the Northwestern Federal district for making economically substantiated management decisions taking into account their specific features.

The theoretical significance consists in the fact that the study expands scientific knowledge in the field of management decision-making in FEC sustainable development in the region and its constituent entities through territorial decomposition of BSC assessment of PER.

The practical value of the research is to develop the territorial decomposition of BSC assessment of PER which help objectively and correctly assess the stability FEC development of a constituent entity of the Northwestern Federal district, which contributes to the transformation of FEC in NWFD into a flexible, adaptable system with high resistance to the disturbing environmental influences.
